

FIG. 261.—Section taken from the area between the emphysematous and edematous areas of gangrene. It shows extreme edema between muscle fibers and their envelopes, and between muscle bundles, and a beginning formation of gas within muscle fibers. It is a typical example of the tissue changes in the toxic form of gas gangrene which, if it does not cause amputation or kill, goes on to the pure emphysematous type. Accession number 2891, Army Medical Museum. Negative number 45626. Hematoxylin and eosin stain; $\times 290$
